

**AMENDMENTS TO THE ABSTRACT**

Please substitute the following paragraph(s) for the abstract now appearing in the currently filed specification:

--An elastic dust cover, disposed between the outer circumferential surface of a housing and outer circumferential surface of a stud portion of a ball stud, is attached in a manner blocking an opening portion of the housing. In the dust cover, a first lip portion which is closely fitted in a condition urged toward an end face on a ball portion-side of a brim portion of a ball stud is provided. Even in a case where the ball stud is relatively greatly swayed with respect to the housing, since the first lip portion and a second lip portion follow the brim portion to be closely fitted, sealing can be satisfactorily provided.--
